

DeskCenter .Pocket

Mobile Stocktaking and Inventory Control

With DeskCenter .Pocket it is possible to access and edit all system and component information and their asset data offline via Pocket PC. Barcode and RFID technology is fully integrated into DeskCenter .Pocket. In combination with a wireless barcode scanner it is especially easy and comfortable to carry out physical inventory or to edit asset data directly on site.

Mobile Access

Just put your inventory devices into your pocket and carry them with you, wherever you plan to inventory. With DeskCenter .Pocket you have mobile access to all your system's and component's information.

Creating and editing Assets

You can access and edit all asset data of your systems and components (printers, displays etc.) offline with your Pocket PC. You can also enter new asset information or create new systems or components directly on site.

Stock Control

With a physical inventory you assure that your assets information is always up to date. You need no extra inventory lists or manual check lists.

Barcode Scanner Support

Barcode and RFID technology is fully integrated into DeskCenter .Pocket. You can easily identify all your systems and components via barcode scanner (Bluetooth or integrated).

Easy Synchronization

DeskCenter .Pocket automatically synchronizes with the DeskCenter database to transfer all offline/mobile data.

Seamless Integration

DeskCenter .Pocket is fully integrated into the DeskCenter Management Suite.

Stocktaking and Inventory

The inventory is arranged in a tree structure, which is subdivided into locations and rooms. All computers and components assigned to a room are displayed under the corresponding level. This view shows all devices registered in a location or room at the time of the latest synchronization. Devices that have previously been inventoried can be manually marked as available.

Label Check

New devices which are labelled with prefabricated labels can be inventoried via Label Check. This method is reliable and error-free. By scanning the serial number of the system and the label, DC .Pocket compares the information with the database. This provides the most important system information directly on site.

Finding Systems and Components

You can search for systems or components by entering a serial number, a barcode or an inventory number. If your search returns exactly one result, the editing window for the respective device will be displayed automatically. If your search returns multiple results, you will see a list of all devices found. To make identification of computers and components easier, each category has its own symbol.

DeskCenter .Pocket Hardware Bundle

To ensure an optimal combination of hardware and software, DeskCenter recommends a special Pocket hardware bundle consisting of:

- HP iPAQ 200 Enterprise Handheld
- Bluetooth Barcode Scanner Metrologic VoyagerBT
- DeskCenter .Pocket Modul
