

OS Deployment

OS Deployment in a new dimension

The automated setup of an entire operating system with DeskCenter Management Suite means major time savings for the IT department and spares the administrator's nerves. From now on it is possible to set up a PC or server system, starting from the operating system to all necessary applications and patches, from one central point. To manage all necessary drivers and create complete images for a worry-free implementation.

The challenge

The IT industry provides the market with new developments faster than ever. The result is a continually increasing demand for applications inside the companies. IT administrators have to face the problem to install a new operating system shortly and provide it to all clients at the same time. At this point a safe and intelligent setup has top priority. We face the challenge of an automatic and cost-efficient OS Deployment.

EasyDeploy

DeskCenter EasyDeploy makes it possible to start deployment jobs directly from the system overview with just a few clicks. For an even faster, simpler and successful OS Deployment.

DeskCenter OS Deployment integrates seamlessly into the existing client and server management of the Suite. In combination with the module Software Deployment and Patch Management, it is a vastly improved toolset for modern IT management.

Rollout Operating Systems efficiently

Key Features

- Totally automated deployment of operating systems
- Managing installation and activation keys in the product key database
- Reservation of Microsoft® Windows keys for MAC addresses
- Fully unattended installations of client and server systems
- Creation and deployment of complete images
- Driver management: drivers support in a central database
- Generation of driver packages with DeskCenter EasyExtract
- Integrated editor to create answer files
- Start deployment jobs directly from the System Manager
- Support for all common Microsoft® Windows operating systems and servers

Easy and comfortable OS Setup

OS Deployment with DeskCenter Management Suite allows an individual and fully automated installation exactly to your needs. With only a few clicks, you can deploy all your clients with the suitable operating system, even in complex IT infrastructures. The Suite supports migration processes for all common MS operating systems, whether 32 Bit and 64 Bit versions.

Dynamic Driver Loading

With DeskCenter's driver wizard **EasyExtract** existing drivers can be read out from a PC system and integrated into the Suite. The integrated driver database manages all drivers centrally at one point. The driver packages will be contained in the installation process automatically and without loss.

OS Deployment redefined

By linking a license key with a PC system it is possible to associate this key with the belonging network MAC address (even before the actual installation). This guarantees the appropriate allocation of a license key, matching with the license contract of each profit center and site.

Your Advantages

- Less number of installation errors
- Minimizes manual deployment processes
- Optimized key management for a lower effort
- Deployment of hundreds of clients at the same time
- Start deployment jobs with only few clicks
- Recognizes, manages and assigns drivers automatically
- Integration of Patch Management and Software Deployment into the OS roll-out process

License

Like all other DeskCenter Management Suite modules, DeskCenter OS Deployment is licensed per client. OS Deployment requires the Basic Package.
